

# METHOD OF CLEANING A CVD DEVICE

## Abstract

A CVD vacuum vessel including an electrically conductive partition plate which divides the interior of the vacuum vessel into a plasma generating space and a film-deposition processing space, and an electrically conductive spiral shield. The electrically conductive partition plate has a plurality of through-holes connecting the plasma generating space to the film-deposition processing space and a heater for heating the electrically conductive partition plate. The partitioning plate is mounted to the vacuum vessel by means of a mounting screw such that electrical contact between the partitioning plate and the vacuum vessel is achieved through said spiral shield.
